Technical Report #449

FOREWORD

This investigation was a collaboration between the Southern California Coastal Water Research Project and the University of California, Berkeley School of Public Health. This project was funded by the City of San Diego through a Supplemental Environmental Project (ACL No.2001-094) and the San Diego Regional Water Quality Control Board through the Clean Up and Abatement Fund (SWRCB Contract No. 02-166-190-0). The conclusions represent those of the authors and are not necessarily the position of the City of San Diego, the State of California, or the U.S. Environmental Protection Agency (U.S. EPA). Mention of trade names does not constitute an endorsement by the City of San Diego or the State of California.

ACKNOWLEDGEMENTS

We would like to thank the many organizations that helped with data collection and/or sample processing on this project. Fecal indicator bacterial analysis using traditional methodologies was coordinated by Ric Amador and Laila Othman at the City of San Diego Metropolitan Wastewater Department Microbiology Laboratory (San Diego, CA). Rich Haugland and Al Dufour of the U.S. EPA provided the protocols and some filtration equipment for analysis of enterococcus and *Bacteroides* using quantitative polymerase chain reaction (QPCR). The QPCR was conducted by Charles LaCerra of EMSL, Inc. (Westmont, NJ). Virus and coliphage measurements were coordinated by Mark Sobsey of the University of North Carolina (Chapel Hill, NC). The human health data collection was coordinated by Susan Burns and Jackie Hayes at the UC Berkeley Survey Research Center (Berkeley, CA). Data management and analytic support were provided in part by Srikanth Arunajadai and Shannon Carr at the UC Berkeley School of Public Health.

The authors also wish to acknowledge the invaluable guidance provided by the independent scientists of the project Steering Committee (in alphabetical order):

Rebecca Calderon	United States Environmental Protection Agency
Richard Gersberg	San Diego State University
Michele Ginsberg	San Diego County Department of Environmental Health
Mark Gold	Heal the Bay
Charles McGee	Orange County Sanitation District
John Witte	University of California, San Francisco

We would also like to acknowledge the support of our contract managers, Christina Arias and Leslie Dobalian, from the San Diego Regional Water Quality Control Board; and advice from Ruth Kolb from the City of San Diego and Clay Clifton from the San Diego County Department of Environmental Health.

ABSTRACT

Fecal indicator bacteria are routinely monitored at marine recreational bathing beaches to assess the public health risk of contracting swimming-related illness. There have been numerous epidemiology studies that demonstrated the relationship of indicator bacteria to health risk, but they have been mostly conducted on beaches impacted by point sources with known human fecal contributions. Few studies have examined this relationship at beaches where non-point sources are the dominant fecal input source.

Here, we present an epidemiology study conducted in Mission Bay, California, where nearly 20% of the historic routine bacterial samples failed water quality standards but the dominant fecal source appears to be non-human. The study focused on three primary questions: (1) Did water contact increase the risk of illness during the two weeks following exposure to water? (2) Among those individuals with water contact, were there associations between illness and measured levels of traditional indicators of water quality? and (3) Among those individuals with water contact, were there associations between illness and measured levels of non-traditional indicators of water quality?

The project was designed as a cohort study. Nearly 8,800 participants were recruited from the six most popular swimming beaches in Mission Bay on weekends and holidays during the summer of 2003. Each participant provided their current state of health and degree of water exposure on their day at the beach. On the same day, water quality was monitored for traditional fecal indicator bacteria (enterococcus, fecal coliforms, total coliforms). A subset of samples was also measured for non-traditional indicators, including new methods for measuring traditional indicators (chromogenic substrate or quantitative polymerase chain reaction [QPCR]), new bacterial indicators (*Bacteroides*), and viruses (somatic and male-specific phage, adenovirus, Norwalk-like virus).

Ten to 14 days later, the participants were contacted by phone and interviewed about symptoms of illness that occurred since their visit to the beach. They were queried about multiple types of illness: gastrointestinal illnesses (diarrhea, nausea, stomach pain, cramps, vomiting, highly credible gastrointestinal illness 1 or 2 [HCGI-1 or HCGI-2]); respiratory illnesses (cough, cough with phlegm, nasal congestion or runny nose, sore throat, significant respiratory illness); dermatologic outcomes (skin rash, infected cuts or scrapes); and non-specific symptoms (fever, chills, eye irritation, earache, ear discharge, eye irritation or redness). Multivariate analysis was conducted to assess relationships between health outcomes and degree of water contact or levels of water quality indicators. These analyses were adjusted for confounding covariates such as age, gender, and ethnicity.

Of the measured health outcomes, only skin rash and diarrhea were consistently significantly elevated in swimmers compared to non-swimmers. For diarrhea, this risk was strongest among children 5 to 12 years old. The risk of illness was uncorrelated with levels of traditional water quality indicators. Of particular note, the state water quality thresholds were not predictive of swimming-related illnesses. Similarly, no correlation

was found between increased risk of illness and increased levels of most non-traditional water quality indicators. A significant association was observed between the levels of male-specific coliphage and HCGI-1, HCGI-2, nausea, cough, and fever, but we interpret these associations cautiously because so few participants were exposed to the water at times when male-specific coliphage was detected.

While we found that traditional fecal indicators were ineffective predictors of health effects, it is difficult to extrapolate this finding beyond Mission Bay. Mission Bay is unusual in that it has been subjected to thorough cleanup activities that source tracking studies confirm leave human fecal sources as only a minor contributor. Moreover, Mission Bay has an unusually long hydraulic residence time compared to other coastal systems, which affects the age and viability of waterborne fecal material. This study, though, does suggest the need for further evaluation of traditional indicators in circumstances where non-point sources are the dominant fecal contributors.

INTRODUCTION

Fecal indicator bacteria are monitored routinely at marine recreational bathing beaches to assess the public health risk of contracting swimming-related illnesses. In southern California, more than 85,000 samples are collected and over \$3 million is spent annually to assess public health risk using these bacterial tests as indicators of fecal contamination (Schiff *et al.* 2002). The focus on bacteria as a public health monitoring tool is predicated on the relationship between the density of fecal indicator bacteria and the occurrence of illnesses in the swimming population.

Numerous studies have demonstrated the relationship between fecal indicator bacteria at beaches and the occurrence of swimming-related illnesses (Prüss 1998, Wade *et al.* 2003). Prominent among these studies are Cabelli (1979 and 1983) who observed a relationship between enterococcus and illness rates at several beaches around the country, and Haile *et al.* (1999) who observed an increase in swimming-related illnesses and enterococcus, fecal coliforms, and total coliforms at beaches in Santa Monica Bay, California. These studies were the focal point for the establishment of water quality thresholds at marine beaches using fecal indicator bacteria in the United States and the State of California, respectively.

While these previous epidemiology studies successfully demonstrated the value of fecal indicator bacteria, virtually all of these studies were conducted at locations where human sewage was the predominant contamination source. Haile *et al.* (1999) was the only study to have focused on urban runoff as a source, but even this non-point source was known to contain human sources of fecal contamination. Most of the beach water quality problems in California are attributable to non-point source runoff (Noble *et al.* 2003, Schiff *et al.* 2003), and it is less clear that the health relationships for bacterial indicators will remain the same when non-human sources predominate (Calderon *et al.* 1991). Since animals shed bacterial indicators without some of the accompanying human pathogens, there is considerable uncertainty in extrapolating present water quality thresholds that are based on the risk of swimming-associated illnesses to non-point source situations. A poor correlation between bacterial indicators and virus concentrations has been found when examining urban runoff (Jiang *et al.* 2001, Noble and Fuhrman 2001), in contrast to the significant relationships that have been found when examining water bodies influenced by human sources, such as septic tanks (Lipp *et al.* 2001).

Here, we present an epidemiology study conducted in Mission Bay, California, where state water quality standards have historically been exceeded more than 20% of the time (Schiff and Kinney 2002). Several million dollars have been expended to remove human contamination from the Mission Bay by inspecting and repairing the sanitary sewerage system surrounding the bay and diverting the largest storm drains away from the bay. As a result, recent source tracking studies suggest that human fecal material constitutes a minor proportion of fecal inputs to the Bay (City of San Diego and MEC/Weston 2004). However, exceedances of California's water quality standards continue to occur (Hanley 2002).

The goal of this study was to examine the health effects of swimmers and their relationship to water quality indicators in this system where non-human fecal sources are dominant. The study attempted to answer two primary questions:

- Did water contact increase the risk of illness in the two weeks following exposure to water in Mission Bay during the summer of 2003?
- Among those individuals with water contact, were there associations between illness and measured levels of traditional indicators of water quality?

In addition, we addressed a third question about whether there were associations between illness and measured levels of several nontraditional indicators of water quality. New laboratory methods, particularly nucleic acid-based methods, are promoted as monitoring tools because they are faster, cheaper, or more specific than traditional methods of measuring fecal indicator bacteria that rely on culture- or growth-based endpoints. The efficacy of any new public health monitoring tool can only be evaluated through an epidemiological study that documents its relationship to the incidence of swimming-related illness.

Specifically, we tested a rapid method for measuring bacteria and several measures of viruses. Whereas traditional measurement methods for bacteria are slow (> 18 hrs), we included a nucleic acid-based technique that provides results in less than four hours (Noble and Weisberg et al. In Press). Similarly, virus measurements have been an inefficient monitoring tool to date because of inefficient recovery methods, expense of detection methods, and length of time for obtaining results. Culture-independent, nucleic acid-based techniques allow measurements that are faster, less costly, and more specific. These methods have not been previously evaluated in an epidemiology study.

MATERIALS AND METHODS

This project was designed as a cohort study (NRC 2004). Six of the most popular swimming beaches in Mission Bay were targeted every weekend and holiday from Memorial Day to Labor Day during the summer of 2003. Participants were recruited each sampling day and, after giving consent, their current state of health and degree of exposure to the water were recorded. Water quality was measured at multiple sites and over multiple time periods on the same days as the epidemiological data. Ten to 14 days later, the participants were contacted by phone and interviewed about symptoms of illness that occurred after their visit to the beach. The resulting data were tested for significant differences in illness between swimmers and non-swimmers. Among the participants that swam, the probability of illness was regressed against various measures of water quality exposure. The specific methods used in this study are described below and are organized into four sections: sampling sites, water quality data collection, epidemiological data collection, and data analysis.

Sampling Sites

The study sites were selected based on a pilot study conducted in the summer of 2002. Aerial photography, supplemented with on-the-beach enumeration of swimmers for groundtruthing (to confirm the findings of the aerial survey), was used to identify the locations and times of greatest swimmer activity. Hourly images from 9:00 AM to 6:00 PM were collected on 10 days at 10 different swimming areas in Mission Bay. The pilot study identified the most effective times and locations for maximizing the number of potential study participants.

Recruitment of beach-goers occurred at six Mission Bay beaches on weekends and holidays, beginning Memorial Day weekend and continuing through Labor Day weekend, 2003 (Figure 1). Recruitment took place between 12:00 PM and 4:00 PM each weekend day. Water quality samples were collected at the same six beaches. A total of 18 sites were targeted, with the number of sites per beach ranging from two to five, depending upon the length of beach and anticipated swimming activity (Table 1). Data were collected on 29 of 32 targeted sampling dates; three days were excluded from sampling (June 9, 17, and 18, 2003) due to inclement weather and significantly reduced beach usage.

Water Quality Data Collection

Twelve types of water quality measures were collected during this study. Three were traditional indicators (enterococcus, total coliforms, fecal coliforms) measured by traditional methods (membrane filtration [MF]). Three were the same indicators measured using the newer chromogenic substrate (CS) method. One was enterococcus measured by a new method, quantitative polymerase chain reaction (QPCR). The final five were new indicators (*Bacteroides*, somatic coliphage, male-specific coliphage, adenovirus, and Norwalk-like virus).

Water quality samples were collected at one of three temporal intensities, depending on indicator, which was necessitated by differences in sample volume, laboratory effort, and cost of the various methods (Table 2). The greatest sampling intensity occurred at all 18 sites hourly from 12:30 PM to 3:30 PM. These samples were analyzed by MF for total and fecal coliforms, and for enterococcus using the CS method. The second sampling intensity was also at all 18 sites, but only twice daily (12:30 PM and 2:30 PM). These samples were analyzed for enterococcus and *Bacteroides spp.* using QPCR. The third sampling intensity was a composite sample at each beach, once daily. The composite samples were comprised of the individual sites within each beach at the 12:30 PM sampling interval. These samples were analyzed for total and fecal coliforms (*E. coli*) using CS, enterococcus using MF, somatic and male-specific phage, and adenovirus and Norwalk-like virus.

Samples for analysis of total coliforms, fecal coliforms, and enterococcus were collected in 125 mL sterilized high-density polyethylene (HDPE) bottles. Composite samples for these

constituents were created by pouring the 125 mL HDPE bottles into a single 500 mL sterilized HDPE bottle. Samples for phage were collected in 1L sterilized HDPE bottles, while samples for analysis of virus were collected in 5 x 4L cubitainers. All samples were placed on ice in the dark and transported to the laboratory for processing within six hours. Sample analysis for total coliforms, fecal coliforms, and enterococcus was initiated within the six-hour holding time for these measurements.

Samples for *Bacteroides* and enterococcus QPCR analysis were collected as described by Brinkman *et al.* (2003). Samples for QPCR adenovirus and Norwalk-like virus were first amended with 50mM final concentration MgCl before being passed through glass fiber filters (GF/F) (Whatman, Clifton, NJ) using positive pressure. Following concentration, all filters were stored at -80°C until shipment to the analytical laboratory. Frozen filters were shipped to the laboratory in a cryoshipper containing liquid nitrogen to maintain the integrity of the nucleic acid material. Water samples for phage analysis were stored overnight at 4°C before shipment to the laboratory on ice via overnight express.

Laboratory Methods

Enterococcus was measured using three different techniques. Individual samples from each site were measured using Enterolert™ chromogenic substrate and the Quantitray 2000™ system (IDEXX Westbrook, ME), while composite samples were measured using the 24-hour EPA Method 1600 (m-EI). The third technique used to measure enterococcus was QPCR (Brinkman *et al.* 2003). Unlike the membrane filtration or chromogenic substrate techniques that rely on growth-based endpoints, QPCR relies on amplification of unique DNA sequences to estimate the number of bacterial cells in the original sample (Brinkman *et al.* 2003; Haugland. *In press*). This technique is currently being used by the U.S. EPA in their National Epidemiology Study.

Total coliforms and fecal coliforms were measured using two different techniques. In individual samples, total and fecal coliforms were enumerated by membrane filtration using APHA Method 9222B (m-Endo) and APHA Method 9222D (M-FC), respectively. In composite samples, total and fecal coliforms (*E. coli*) were enumerated using Colilert-18™ chromogenic substrate and Quantitray 2000™ system (IDEXX, Westbrook, ME).

The QPCR method also was used to measure *Bacteroides*, a group of fecal obligate anaerobic bacteria that cannot survive for extended periods in oxygenated environments (Bernhard and Field 2000; Bernhard *et al.* 2003). Measurements of this indicator were performed simultaneously with QPCR measurements of enterococcus.

F+ and somatic coliphages were detected and quantified in 1 L volumes of water by a modification of USEPA Method 1601 for enrichment and spot-plating that provides a Most Probable Number (MPN) estimate of coliphage concentration. One-liter sample volumes were supplemented with 0.05M MgCl₂, host bacteria were added (*E. coli* Famp for F+ coliphages or *E. coli* CN-13 for somatic coliphages), the sample was quickly divided into aliquots of three replicate volumes each of 300, 30, and 3 mL, and these volumes were enriched overnight at 36°C. A small volume of each enrichment culture was spotted onto an agar medium lawn of host bacteria and incubated for 4 hours at 36°C and scored for the presence of coliphages. The number of enrichment cultures that were positive for coliphages were used to compute an MPN concentration.

Analysis of Norwalk-like viruses and adenoviruses on GF/F filters was conducted by molecular methods. Three-quarter pieces of the first 75% of frozen filters with DNA concentrates were eluted and extracted using 1.5% beef extract elution, PEG precipitation, and viral-NA extraction/purification using GITC lysis buffer and Qiagen midi columns, followed by ethanol precipitation. A 2.5 µl volume of the final 50 µl of total concentrate was analyzed using semi-nested PCR. A one-ninth portion of the remaining 25% frozen Whatman GF/F filters was eluted and extracted using lysis buffer directly, followed by purification using the Qiagen plant kit. Of the final 50 µl volume of nucleic acid extract, 5 µl (10%) was used for (RT)-PCR analysis of each virus (human adenovirus, genogroup I norovirus, and genogroup II norovirus).

Table 2. Methods, analytical laboratories, and sampling intensity used for water quality measurements during the Mission Bay Epidemiology Study.

Parameter	Method	Analytical Laboratory	Sampling intensity
Enterococcus	EPA 1600	City of San Diego	Beach composite once per day
Enterococcus	96 well Quantitray	City of San Diego	Hourly sample at every site
Enterococcus	Quantitative PCR	EMSL	Two samples per day at each site
Fecal Coliforms	APHA Method 9222D	City of San Diego	Hourly sample at every site
Fecal Coliforms (<i>E. coli</i>)	96 well Quantitray	City of San Diego	Beach composite once per day
Total Coliforms	APHA Method 9222B	City of San Diego	Hourly sample at every site
Total Coliforms	96 well Quantitray	City of San Diego	Beach composite once per day

Adenovirus 40 and 41	Quantitative PCR	University of North Carolina	Beach composite once per day
Norwalk-like Virus	Quantitative PCR	University of North Carolina	Beach composite once per day

Epidemiological Data Collection

Three study instruments were developed for this project including: (1) an interviewer-administered screening form to assess eligibility and desire to participate; (2) a self-administered questionnaire (SAQ) that was completed by study subjects before they left the beach for the day; and (3) a computer-aided telephone interview (CATI) questionnaire administered to study participants approximately two weeks following their visit to a Mission Bay beach (Appendix 1). The study instruments, in addition to the study protocol and consent form, were approved by the Committee for the Protection of Human Subjects at U.C. Berkeley prior to study initiation.

Beach Recruitment

Interviewers canvassed the study beaches, approaching individuals and groups to determine their interest in and eligibility to participate in the study. Eligibility criteria included: (1) no previous participation in the study; (2) at least one family member of the household at the beach was 18 years old or older; (3) home address in the United States, Canada, or Mexico (interviews were conducted in either English or Spanish); and (4) had not swam (face or head under water) in the ocean or in a lake in the previous seven days. If an individual or household was eligible and agreed to participate, the interviewers obtained signed consent from the individual or all participating adult members of the household. Adults gave signed consent for children under 18. Participants were then asked for their names, their contact information, and their city and state of residence. The household data also contained the background variables of the recruited households, including household size and the language that was used to obtain consent. During the screening process, each participant was assigned a non-informative identification code. Interviewers marked the screening form to identify the water quality sampling site that corresponded best with the location of the individual or family on the beach. Participants were given an incentive (beach ball) and asked to complete the SAQ prior to their departure that day.

The SAQ consisted of 18 questions concerning possible exposures at the beach (i.e., swimming, other activities, food and beverages, other exposures) and exposures or illnesses experienced during the 2-3 days prior to the beach visit. The survey took no longer than 15 minutes to complete. Participants who failed to complete the survey at the beach were contacted within three days by telephone interviewers, and their surveys were completed over the phone. Participants that completed the survey at the beach were given additional incentives (water bottles and beach balls).

Follow-Up CATI Interview

Between 10 and 14 days following their beach visit, participants were telephoned and asked to complete a 10- to 15-minute interview. This interview consisted of the following types of questions: (1) demographic information, including race, income, education level; (2) swimming and other exposures since the interview day; (3) existing health problems potentially related to the study outcomes (e.g., chronic diarrhea); and (4) acute health conditions (gastrointestinal, respiratory, skin, eye, or ear) experienced since the visit to the beach. If acute illnesses were experienced, a series of questions were asked to determine whether the subject had to restrict normal activities (missed work or school, or other activities) and whether they visited a doctor, clinic, or other medical facility for the illness. As with the previous interviews, the head of household answered questions for children under 18.

Health Outcomes Measured

The health outcomes quantified through the CATI interview included gastrointestinal illness, respiratory symptoms, dermatologic symptoms, and other non-specific symptoms. Gastrointestinal illness included nausea, vomiting, diarrhea, and stomach pains or cramps. In addition, two categories of highly credible gastrointestinal illness (HCGI) were measured. HCGI-1 was defined as either: (1) vomiting plus diarrhea or fever; or (2) cramps and fever. HCGI-2 was defined as vomiting plus fever. Respiratory outcomes included cough, cough with phlegm, nasal congestion or runny nose, sore throat, and significant respiratory disease (SRD). SRD was defined as: (1) fever plus nasal congestion; or (2) fever plus sore throat; or (3) cough with phlegm. Dermatologic outcomes included skin rashes and infected cuts or scrapes. Non-

specific symptoms included fever, chills, redness or eye irritation, earache, and ear discharge or drainage.

Data Analysis

Water Quality

Water quality analysis focused on assessment of swimmer exposure, including: (1) identification of the ranges of fecal indicator bacteria densities among beaches; (2) determining whether the compositing strategy within a beach adequately represented the beach average as determined by individual samples at multiple sites across a beach; and (3) correlating the different indicator organisms and methods to ascertain if the densities were providing redundant or unique information relative to swimmer exposure.

Epidemiology

Two principal epidemiological analyses were conducted. The first was a model to evaluate whether there was a significant difference in illness rate between swimmers and non-swimmers. Swimming risk (i.e., swimmers compared to non-swimmers) was contrasted for multiple definitions of “swimming,” including: “any water contact,” “water up to the shoulder,” “water on the face,” “face under the water,” “water in the mouth,” and “swallowed water.” These definitions were designed to reflect qualitatively different levels of exposure to the water.

The second analysis was a model that examined whether there was a significant relationship between the risk of illness in swimmers and water quality (as measured water quality indicators). These models were constructed for each of the measured water quality indicators using numerous approaches for swimmer exposure, including incremental changes for daily geometric mean for all sites at a beach, daily geometric mean for the site(s) nearest the swimmer, and geometric mean for just those site(s) and time(s) nearest the swimmer. Additionally, state water quality thresholds for enterococcus were examined using dichotomous cutpoints (>35 vs. ≤ 35 and >104 vs. ≤ 104) for evaluating risk. In all models involving indicators, a value of zero was used for water quality exposure values below the detection limit.

All analyses were conducted as both univariate and multivariate models. The multivariate models included potential confounding factors as covariates. The covariates examined were age category (0-5, 5-12, 12-30, >30), gender, ethnicity, allergies, history of swimming again after the beach interview, history of collecting shells at the beach, history of digging or having one's body buried in the sand, history of playing with seaweed or algae, history of chronic illnesses (gastrointestinal, asthma, or chronic skin conditions), contact with other sick people, use of insect repellent at the beach, use of sunblock at the beach, history of showering immediately after swimming, consumption of raw or undercooked eggs or meat, income, and consumption of food while at the beach. All variables, except age, were categorized as 1 or 0. Race was collapsed into two categories, white and non-white.

All analyses were conducted using the same basic model that is being used in the U.S. EPA BEACHES study. This is a nested interaction model that allows linear combinations of variables to be estimated. This permits comparisons among swimmers while retaining non-swimmers in the model, as well as comparisons among swimmers versus non-swimmers. The components of the model are:

p = probability of illness

(NOTE: “ $p / (1-p)$ “ defines the odds of illness

X1=1 if any contact with water; 0 otherwise

X2 is the water quality measure

X3 is a 1/0 indicator of other exposure (body contact, head under water, etc.)

Non-swimmers= α

$$\ln(p / (1 - p)) = \alpha + \beta_1 x_1 + \beta_2 (x_1 * x_2) + \beta_3 x_3 + \beta_4 (x_3 * x_2)$$

(NOTE: The model reduces to $\ln(\text{odds}) = \alpha$ when all other variables are set equal to “0”, i.e., the situation representing non-swimmers.

Swimmers-any contact= $\alpha + \beta_1 x_1 + \beta_2 (x_1 * x_2)$

Swimmers-other contact= $\alpha + \beta_1 x_1 + \beta_2 (x_1 * x_2) + \beta_3 x_3 + \beta_4 (x_3 * x_2)$

In the multivariate analyses, a backwards deletion procedure (Rothman and Greenland 1998) was used to identify factors that most affected the water quality/illness relationship. This procedure uses the following algorithm:

- (1) The full model is fit with all covariates.
- (2) The estimate of interest is saved (e.g., coefficient for association between water quality and illness)
- (3) The first covariate in the list is removed, and then the model is refit
- (4) The estimate of interest is saved.
- (5) The percentage change between the estimate in Step 2 and the estimate in Step 4 is calculated.
- (6) The procedure is repeated for all covariates in list
- (7) After all models have been fit, determine the covariate that had the smallest impact on the water quality/illness relationship (i.e., the smallest percent change). This covariate is removed completely.
- (8) Repeat Steps 3-7 until removal of any single additional covariate produces a change greater than 10% (or some other pre-specified criterion) in the fully adjusted water quality/illness relationship. In this study, a change greater than 10% was used as the criterion for stopping the removal of covariates.

The advantage of this procedure is that it focuses on the exposure/outcome relationship and selects the covariates that are the strongest confounders of this key relationship. This is in contrast to traditional stepwise procedures that focus on the significance, or strength, of the association between the covariate and the outcome (rather than the association between the exposure and the outcome). The disadvantage is that each model can require extremely long times to complete. For example, many of the models required more than one week to complete (running 24 hours/day).

The risk of illness output from the models was expressed as an odds ratio. For models comparing swimmers and non-swimmers, the odds ratio can be interpreted as the odds of a specific illness in swimmers divided by the odds of illness in non-swimmers. Odds ratios (statistically) significantly greater than 1.0 are indicative of illness elevated for swimmers compared to non-swimmers. For models assessing the association between water quality among swimmers, the odds ratios can be interpreted as the increase in the odds of illness per defined unit of increase in the water quality measure among swimmers. The odds ratios were calculated by exponentiating the regression coefficient provided by the model output.

Attributable risk calculations were performed for health outcomes that were significantly increased in swimmers compared to non-swimmers. Attributable risk is a measure of excess risk. For this study, models adjusted for relevant covariates (see above) were used to estimate the percentages of swimmers and non-swimmers ill for any health outcomes with a statistically significant elevated adjusted odds ratio. The adjusted attributable risk estimates were determined by estimating adjusted probabilities of swimmers and non-swimmers from a multivariate logistic model, weighting the covariates at the mean value for each covariate. The adjusted attributable risk was then calculated as the difference between the probability of illness among swimmers with mean levels of covariates and non-swimmers with mean levels of covariates. These results are expressed as the number of excess cases of illness seen among 1,000 swimmers (along with a 95% confidence interval of this estimate).

Emphasis is placed on the multivariate (adjusted) results throughout the report because they correct for confounding from substantial differences in ethnicity, age, beach, and other covariate distributions. The univariate results, though, are provided in Appendices 2 and 3 for the adjusted odds ratios and attributable risk calculations.

RESULTS

Water Quality

A total of 1,897 water samples were collected during the survey, with the sampling schedule and number of samples differing among microbial indicators (Table 3). All intended samples were collected, with the exception of those on June 9, 17, and 18, when drizzle led to a lack of swimmers and sampling was curtailed. With the exception of one sample for traditional indicators that was spilled and four virus samples that were compromised in the freezing/thawing process, every sample collected was analyzed successfully in the laboratory.

Table 3. Number of samples processed for each beach by indicator type.

Beach	Traditional Fecal Indicators	PCR-based Fecal Indicators	Phage	Virus
Bonita Cove	324	131	25	24
Crown Point	324	132	23	22
De Anza Cove	207	88	26	25
Leisure Lagoon	539	219	24	23
Tecolote Shores	304	132	24	24
Visitors Center	200	88	24	23
Total	1897	790	151	141

Traditional fecal indicator bacteria

A wide range of traditional bacterial densities were measured over the course of the study (Table 4). The majority of samples had quantifiable levels of enterococcus, fecal coliform, and total coliform; between 16% and 40% of the samples were below the method detection limits, depending upon the indicator. Maxima for all three bacterial indicators ranged to 10^5 MPN/100mL. About 16% of all samples that measured traditional fecal indicator bacteria exceeded state water quality thresholds, with enterococcus accounting for most of the exceedances (96%) and total coliforms the least (2%).

Table 4. Range of concentrations for traditional water quality indicators (number/100 mL) and frequency of exceedance (N=1,897) of the State of California's water quality threshold.

	No. of Samples Below RL	Geomean	Maximum	No. of Samples Exceeding Threshold	State Water Quality Threshold
Enterococcus-CS	585	29	57,940	265	>104
Fecal Coliform	304	25	48,000	99	>400
Total Coliform	808	102	45,000	5	>10,000
Total:Fecal Ratio	-	-	-	75	Total:Fecal < 10 WhenTotal > 1,000

The lowest average concentrations occurred at Crown Point (Figure 2), where less than 6% of the enterococcus values exceeded state water quality thresholds. The highest densities of

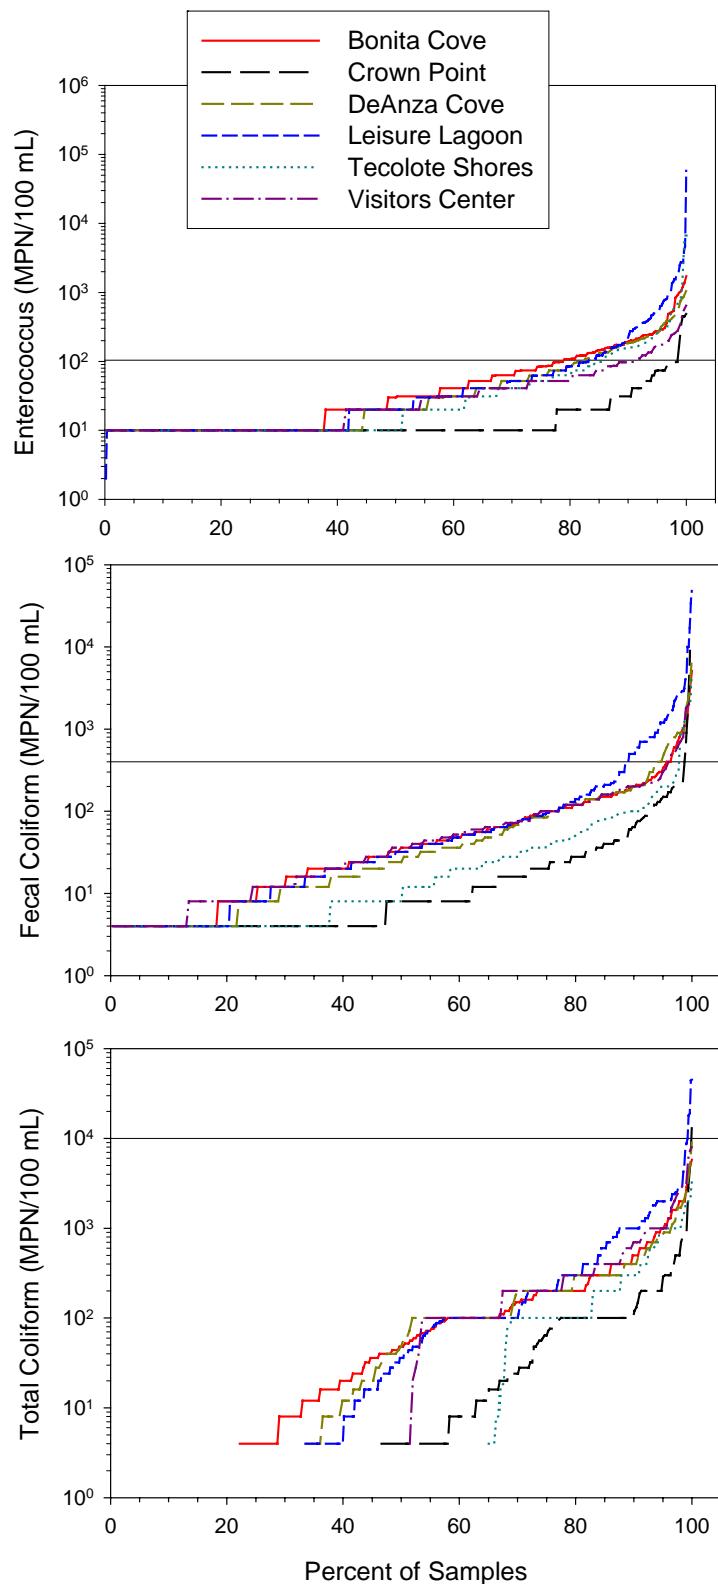

Figure 2. Cumulative distribution frequency for enterococcus, fecal coliform, and total coliform by study beach. The horizontal line indicates the state's water quality threshold (see table 4).

enterococcus were observed at Leisure Lagoon with maximum densities reaching 57,940 MPN/100mL. The greatest frequency of water quality exceedances occurred at Bonita Cove. More than 21% of the samples collected at this beach exceeded state water quality thresholds.

Non-traditional fecal indicator bacteria

A wide range of non-traditional bacterial densities were measured over the course of the study (Table 5). The majority of samples had quantifiable levels of enterococcus and *Bacteroides*, with 6% and 37% of the samples below method detection limits, respectively. Maxima for both bacterial indicators ranged from 10^5 to 10^6 MPN/100mL. For enterococcus, 42% of samples exceeded the state water quality threshold. There is no state water quality threshold for *Bacteroides*.

Table 5. Range of concentrations (number/100 mL) for non-traditional fecal indicator bacteria.
QPCR = quantitative polymerase chain reaction.

	No. of Samples Below RL	Geomean	Maximum	No. of Samples Exceeding Threshold	State Water Quality Threshold
Enterococcus-QPCR	46	65	141,053	351	>104
Bacteroides	294	102	3,718,815	-	-

Only minimal correlation was found among traditional and non-traditional fecal indicator bacteria indicators (Table 6). The best relationships were among the traditional indicator bacteria, particularly the coliform groups. The worst relationships were for *Bacteroides*, which might be expected since they are functionally a different group of microorganisms. For enterococcus, the relationship between the growth-based assay and the nucleic acid-based technology was not strong (Figure 3). QPCR overestimated the enterococcus density compared to the growth-based assays, possibly due to the presence of non-viable DNA, which are only measured by PCR.

Table 6. Correlation coefficients between traditional and non-traditional fecal indicator bacteria.
CS= chromogenic substrate; QPCR = quantitative polymerase chain reaction.

	Fecal Coliform	Enterococcus-CS	Enterococcus-QPCR	Bacteroides
Total Coliform	0.51	0.40	0.28	0.01
Fecal Coliform		0.35	0.17	0.01
Enterococcus-CS			0.24	0.24
Enterococcus-QPCR				0.01

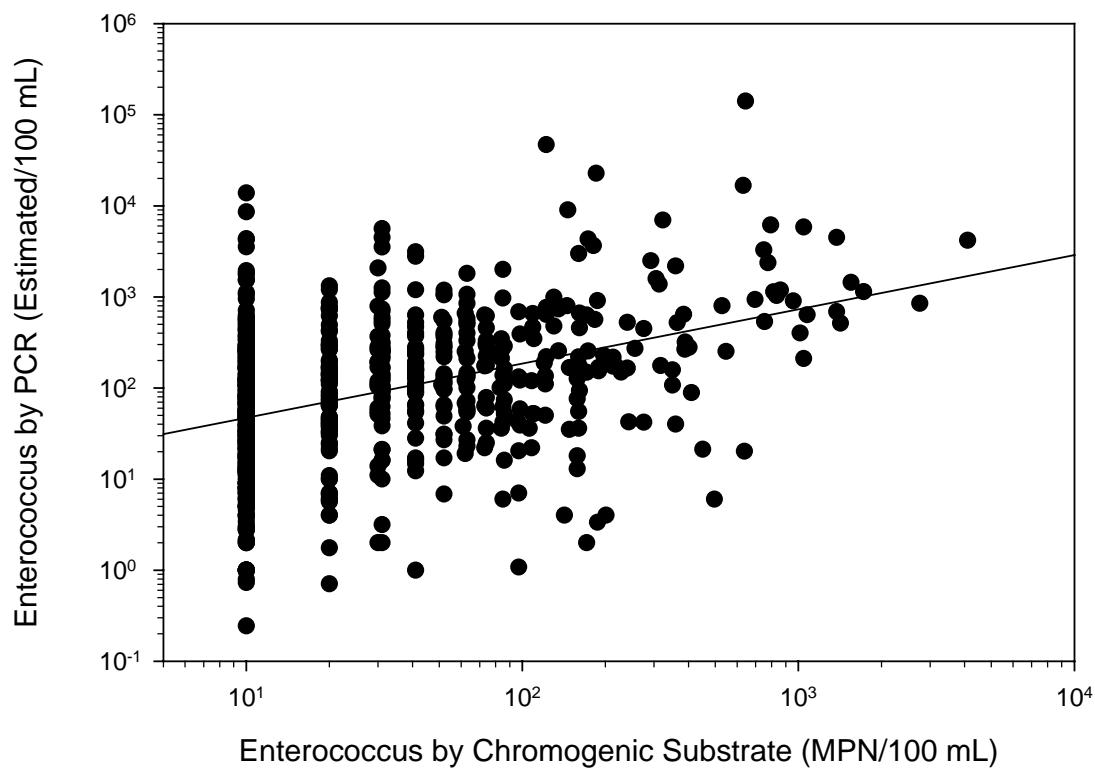

Figure 3. Comparison between enterococcus using traditional growth-based assay (chromogenic substrate) versus the non-traditional nucleic acid-based (QPCR) technology.

Virus Measurements

Virtually no pathogenic virus was detected in the samples collected from Mission Bay over the course of the study (Table 7). There were no detectable Norwalk-like virus and only a single sample detected for adenovirus. The majority of samples had quantifiable levels of somatic phage, but not for male-specific phage, which is more strongly associated with human fecal material (Figure 4). Roughly 68% of the samples had detectable levels of somatic phage and maximum concentrations were observed near 36 MPN/100 mL. Male-specific phage was detected in 11% of the samples and maximum concentrations reached only 1 MPN/100 mL.

Table 7. Range of concentrations (number/100 mL) for virus measurements.

	Total No. of Samples	No. of Samples Below RL	Geomean	Max
Adenovirus	151	150	-	0.01
Norwalk-like Virus	151	151	-	-
Male-specific Phage	141	125	0.2	0.78
Somatic Phage	141	45	0.6	36.6

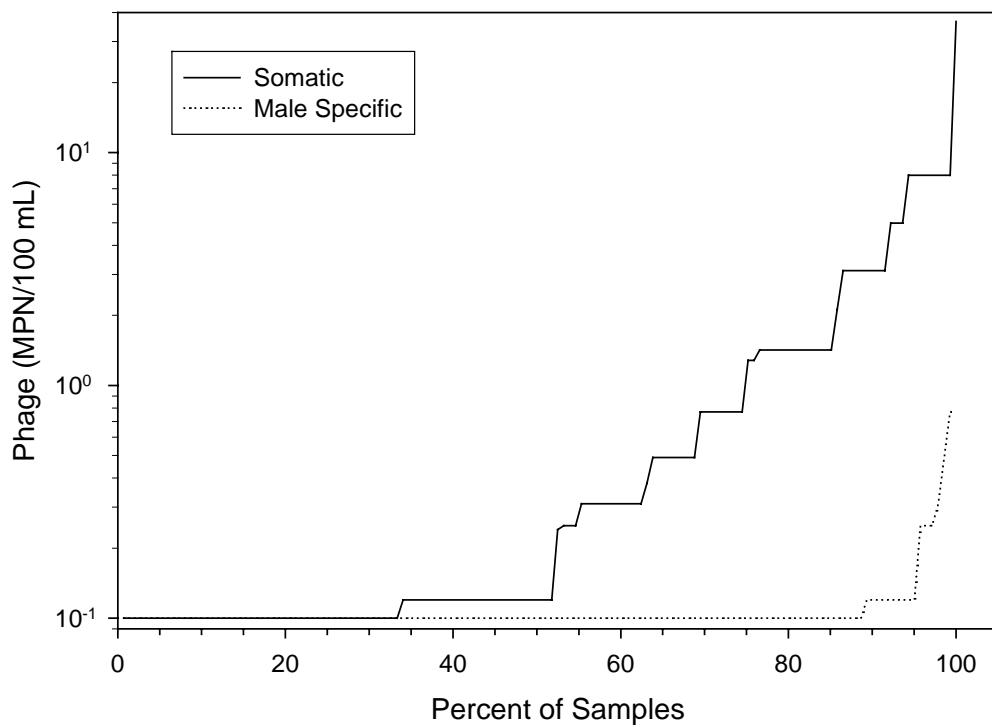

Figure 4. Cumulative distribution frequency for somatic and male-specific phage in Mission Bay during the study.

Effectiveness of compositing

Comparisons of composite samples to averages of individual grab samples for a site indicated that compositing was effective in representing beach-wide water quality for enterococcus (Figure 5). Compositing described 69% of the variability in the individual grab sample arithmetic means ($r^2 = 0.69$), and the y-intercept closely approximated the origin. This relationship was considered quite reasonable considering laboratory duplicate analysis described 61% of the variability observed between paired laboratory analyses from the same sample container using the same (chromogenic substrate) method ($r^2 = 0.61$). Significant relationships existed for composite samples versus the arithmetic mean of individual grab samples ($r^2 = 0.39$) for the fecal coliforms. Fecal coliform comparisons may be hindered because the chromogenic substrate method quantifies *E. coli* while the membrane filtration quantifies the entire fecal coliform group. The weakest relationship between composite samples and the arithmetic mean of individual grab samples was for total coliform ($r^2 = 0.06$).

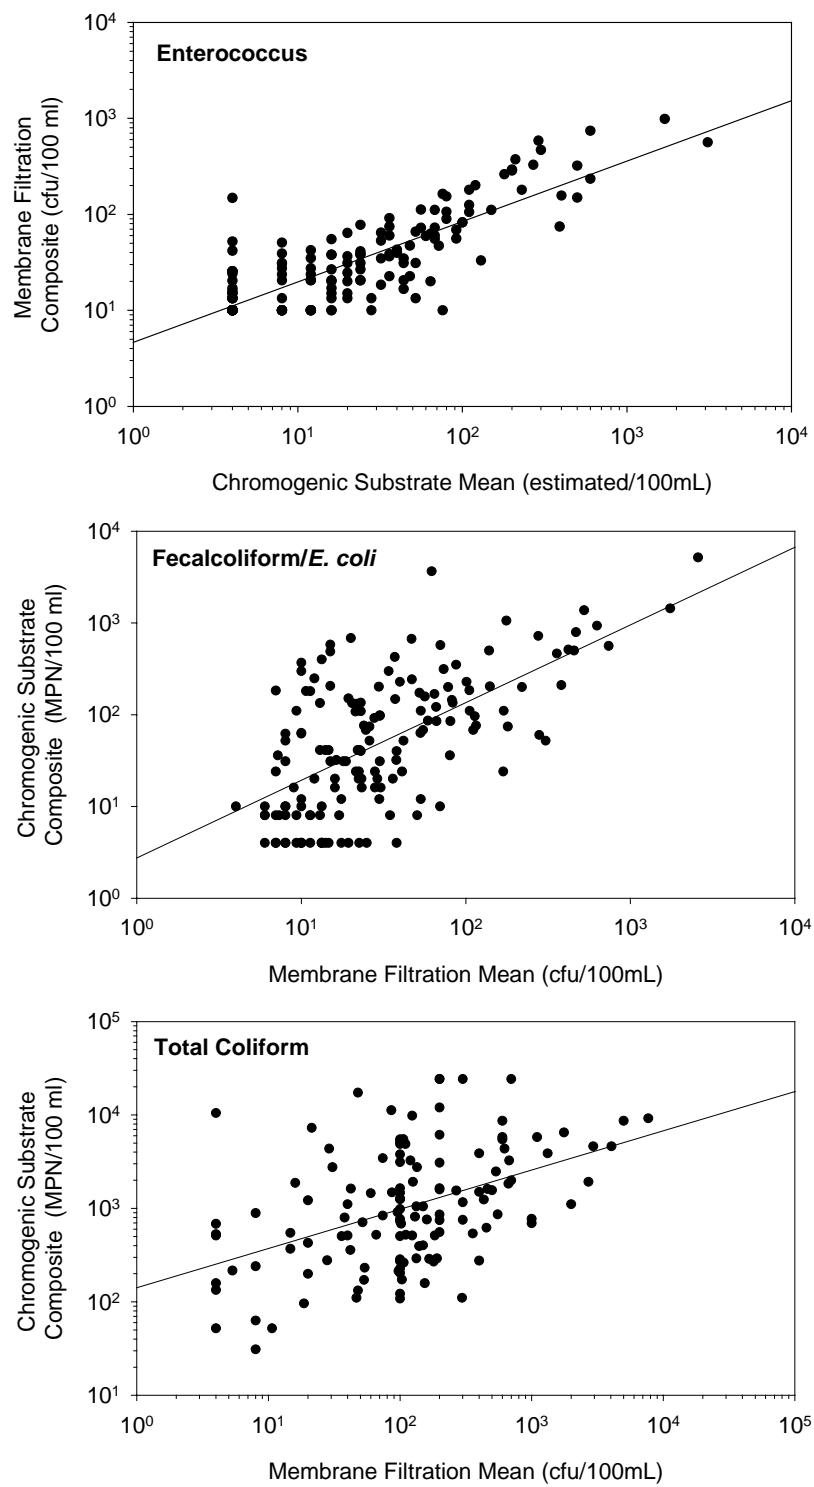

Figure 5. Comparison of compositing versus the arithmetic mean of individual grab samples for enterococcus, fecal coliform/*E. coli*, and total coliform. Composite and grab samples were analyzed using either the chromogenic substrate or membrane filtration methodologies.

Epidemiology

A total of 12,469 individuals and 5,062 households were enrolled in the study. Of these, 8,797 (71%) of the enrolled participants and 3,501 (69%) of the households completed the follow-up telephone interview (Tables 8 and 9). Fifty-seven percent (n=4,971) of those that completed the follow-up interview were swimmers, compared to 3,742 non-swimmers. Non-swimmers were largely comprised of teens and adults aged 12 and older. In contrast, swimmers were roughly evenly divided among age groups with the majority (n=1,461, 29%) being 5 to 12 years old. There were slightly more males (54%) than female (45%) participants, which remained similar among swimmer and non-swimmer categories. Participants were dominated by Hispanic (54%) and white (28%) ethnicities.

Tabulations of participant responses (all beaches combined and separately by beach) to questions regarding sociodemographic characteristics, and exposures prior to, during, and following their visit to the beach can be found in Appendices 4, 5, 6 and 7, respectively.

Table 8. Individual sociodemographic characteristics collected from study participants at all beaches from Mission Bay.

Health Outcomes for Swimmers versus Non-swimmers

Only two of the 14 health outcomes evaluated had an odds ratio that was consistently significantly elevated across all water exposures after adjustment for covariates (Table 10). The two outcomes for which there was increased risk were skin rash and diarrhea. Complete results for all health outcomes and all definitions of water exposure can be found in Appendix 2.

While the risk of diarrhea was significantly increased among swimmers compared to non-swimmers, the risk was greatest in a narrow age band (Table 11). Five- to 12-year-old children had at least double the odds of this health outcome after any water contact compared to non-swimmers of the same age. The elevated odds ratio in this age group was seen across multiple definitions of water exposure ranging from “any water contact” to “swallowed water.”

The risk of diarrhea was greater in Caucasian swimmers than in Hispanic swimmers, particularly among those who reported swallowing water (Table 12). The risk of diarrhea was significantly elevated for all ages of Caucasians after swallowing water, but was highest in Caucasian swimmers aged 5 to 12 years old. Although the risk of diarrhea was not statistically significantly elevated in Hispanic swimmers, the greatest odds ratios were observed in the 5- to 12-year-old age group. In contrast to the ethnic differences observed for diarrhea, the risk of skin rash was comparable between Caucasians and Hispanic swimmers despite increased water exposure. Odds ratios for skin rash were greatest in the 0- to 5-year-old age group compared to other age groups. When comparing ethnicity, odds ratios for skin rash were always greatest in Hispanic swimmers compared to Caucasians of the same age group.

Table 10. Adjusted odds ratios (swimmers vs. non-swimmers) for health outcomes using various definitions of water exposure. Bolded numbers indicate statistical significance.

The calculated attributable risks (Table 13) for diarrhea estimated an excess of 11.1 cases of diarrhea per 1,000 swimmers who had any contact with the water in Mission Bay during the study period. This risk increased as the intensity of water exposure increased, with 16.1 per 1,000 among those who reported facial contact with water and 27.2 cases per 1,000 swimmers who reported swallowing water. Children aged 5 to 12 years old had the greatest attributable risk for diarrhea following swimming. For example, this age group showed an estimated excess of 27.4 cases per 1,000 among children with any water contact, an excess of 31.9 cases per 1,000 among those with facial contact with the water, and an excess of 59 cases per 1,000 among those who swallowed water. Excess cases of skin rash were highest in the 0- to 5-year-old age group, ranging from an excess of 46.8 per 1,000 with any water contact to 56.2 per 1,000 swimmers in this age group who swallowed water.

Relationship between Health Outcomes and Water Quality

No correlation was observed between increased risk of illness and increased levels of traditional water quality indicators including enterococcus, fecal coliform, or total coliform. Using diarrhea as an example, odds ratios were not statistically significantly elevated due to increases in enterococcus (Table 14). The lack of relationship resulted despite numerous approaches to water quality exposure (i.e.. combining or separating sites at a beach) or calculation of indicator metrics (i.e., daily geometric mean, daily maxima, or various cutpoints). Of particular note, the state water quality thresholds did not correlate with an increased risk of illness (Table 15).

Additionally, no correlation was found between increased risk of illness and levels of Bacteroides, enterococcus using rapid methods (QPCR), human pathogenic virus (adenovirus and Norwalk-like virus), or somatic phage. The relationship with viruses was difficult to evaluate, though, because no human pathogenic virus was found and adenovirus was only found in one sample. While low virus counts do not allow evaluation of a potential relationship with the two symptoms that were elevated in swimmers (skin rash and diarrhea), the low counts were consistent with the absence of increased health risk for the other health outcomes evaluated.

Significant associations between the levels of male-specific coliphage and HCGI-1, HCGI-2, nausea, cough, and fever were observed (Table 16). However, a low number of participants were exposed to the water at times when male-specific coliphage was detected (Table 17). Therefore, the relationships between male-specific coliphage and various outcomes should be interpreted cautiously. Results for all health outcomes for various indicator and water exposure levels are presented in Appendix 3.

Table 14. Adjusted odds ratio for diarrhea after two weeks for various water quality exposure metrics for enterococcus. The unit change in exposure in these models was set to represent a change of (ln 30). There were no statistically significant results.

	Any Water Contact	Water on Face	Swallow Water
Ln Daily Geomean @ Station Level	0.57 (0.30 – 1.07)	0.66 (0.32 – 1.34)	0.21 (0.05 – 0.85)
Ln Daily Geomean @ Beach Level	0.77 (0.33 – 1.80)	0.62 (0.24 – 1.60)	0.31 (0.06 – 1.59)
Ln Daily Max @ Station Level	0.67 (0.45 - 1.02)	0.77 (0.47 – 1.24)	NA
Ln Daily Max @ Beach Level	0.99 (0.71 – 1.38)	0.93 (0.64 – 1.34)	NA

Total	203	4,031	4,234

Time in the water

We also examined whether swimmers with prolonged water exposure (>1 hour) to Mission Bay had an elevated risk of illness compared to non-swimmers and found an OR of 1.44, 95% CI 1.08-1.92. This result is similar to that found in Table 10 for swimmers with any water contact compared to non-swimmers (1.36, 95% CI 1.04-1.78), suggesting a small but insignificant increase in the risk from prolonged exposure.

Among swimmers with greater than 1 hour of water exposure, the odds ratio for a 30-unit (3.4 log) increase in enterococcus was 0.74 (0.23-2.36). This result is similar to that seen for the risk of diarrhea among swimmers (defined as “any water contact”) exposed to enterococcus (0.57, 95% CI 0.30-1.07) for exposure measured as the ln of the daily geometric mean at the station level (Table 14).

DISCUSSION

Unlike most previous marine recreational epidemiology studies, this study found no relationship between illness rates and fecal indicator bacteria densities despite investigating numerous exposure measures. Wade *et al.* (2003) systematically reviewed 27 highly relevant marine recreational water epidemiology studies and found an increase in relative risk with increasing fecal indicator concentrations, particularly for enterococcus. For example, the observed increase in risk of swimming-associated illnesses from both Cabelli *et al.* (1982) and Haile *et al.* (1999) was highly correlated with increasing enterococcus concentrations. In virtually all of the studies summarized by Wade *et al.* (2003), however, water quality was impacted by known sources of human fecal contamination. The relationship with enterococcus, or any other fecal indicator bacteria, did not exist in Mission Bay, and one explanation for this difference may be the predominance of non-human fecal sources in Mission Bay. While animal sources can also harbor disease-causing agents, they are less likely to serve as vectors for human disease (NRC 2004).

The use of bacterial indicators as a predictor of swimming-associated illnesses is based on the presumption that they have survival properties similar to the pathogens they are intended to mirror. This presumption is less likely to remain true when circulation is restricted and residence times increase, which can be days to weeks in Mission Bay (Largier *et al.* 2003). Increased survival, and perhaps even regrowth of fecal indicator bacteria, has been suggested in sediments and wrack lining beaches including Mission Bay (Weiskel *et al.* 1996, City of San Diego/MEC Weston 2004). Regardless, the lack of relationship of non-human sources of fecal indicator bacteria to health risk suggests that the 28 water contact advisories posted at beaches in Mission Bay during the course of this study were misleading from a public health perspective, but were required by law.

It is arguable whether the viral measures in our study were better indicators of health risk and could be used in place of bacterial indicators for health risk assessments in Mission Bay. We found that increasing density of male-specific phage was correlated with increased incidence of several health outcomes, including HCGI-1, HCGI-2, nausea, cough, and fever. This is consistent with the success of this measure in freshwater application (Lee *et al.* 1997). However, we interpret these associations cautiously because male-specific coliphage were not detected often and so few subjects were exposed to the water at those times.

The human-specific viruses we measured in Mission Bay were rarely detected, which corresponds well with our low rates of swimming-associated illnesses. We did not encounter high virus counts that would have allowed us to assess their effectiveness as predictors in the positive direction. Moreover, even interpretation of viruses as negative predictors is compromised by technology limitations. We used the most advanced techniques available, but quantifying virus particles in seawater is difficult because DNA and RNA are lost due to complexation and interferences when concentrating and extracting nucleic acid material. Thus, we cannot be certain that the low levels we

observed were due to their absence from the system or from difficulties in recovering viruses that were present. However, our results do suggest that these non-bacterial measures have the potential to be more effective than traditional bacterial indicators as predictors of illness when non-human sources are dominant.

While we found that traditional fecal indicators were ineffective predictors of health effects in this study, it is difficult to extrapolate this finding beyond Mission Bay. Mission Bay is unusual in that it has been subjected to extensive cleanup activities and source tracking studies have identified that human fecal sources are now only a minor contributor to the overall bacterial load (City of SD/MEC Weston 2004). Our study, though, does suggest the need for further evaluation of traditional fecal indicator bacteria in circumstances where non-point, non-human contributions are the dominant fecal source.

It is important not to extrapolate our results beyond our study conditions. We would expect to see an increase in health risks, and likely an association with water quality indicators, if large sources of untreated human fecal material entered the Bay. Such a situation could occur when sewage overflows spill into the Bay.

Finally, we examined swimming-related illnesses during dry weather. No epidemiological data at any beach currently exists for health risks associated with swimming at these beaches following wet-weather events.

STUDY CONCLUSIONS

The Mission Bay Epidemiology Study was successfully implemented, collecting sufficient water quality data and recruiting sufficient numbers of participants. Based on the resulting data, the answers to our study questions can be summarized as follows:

- *Water contact moderately increased the risk of illness in the two weeks following exposure to water in Mission Bay during the summer of 2003.*

Two of the 14 health outcomes evaluated had an odds ratio that was significantly elevated after adjustment for covariates. The probability of skin rash and diarrhea was consistently significantly elevated in swimmers compared to non-swimmers in Mission Bay during the summer of 2003. The probability of more severe health outcomes such as highly credible gastrointestinal illnesses (HCGI-1 or HCGI-2) and significant respiratory disease (SRD) were not significantly elevated in swimmers compared to non-swimmers.

- *Among those individuals with water contact, there were no associations between illness and measured levels of traditional indicators of water quality.*

No correlation between increased risk of illness and increased levels of traditional water quality indicators (including enterococcus, fecal coliform, or total coliform) was found. This resulted despite numerous approaches to water quality exposure (combining or separating sites at a beach) or calculation of indicator metrics (daily geometric mean or maxima, various cutpoints, etc.). Of particular note in this study, the state water quality thresholds were not predictive of swimming-related illnesses.

- *Among those individuals with water contact, there were no associations between illness and measured levels of any non-traditional indicators of water quality except for male-specific coliphage.*

No correlation between increased risk of illness and increased levels of *Bacteroides*, enterococcus using rapid methods (QPCR), human pathogenic virus (adenovirus and Norwalk-like virus), or somatic phage was found. Since traditional enterococcus methods were unsuccessful at predicting swimming-associated illnesses, it is not surprising that the newer, more rapid methods were equally unsuccessful. Virtually no human pathogenic virus was found; adenovirus was only quantified in one sample. A significant association between the levels of male-specific coliphage and HCGI-1, HCGI-2, nausea, cough, and fever was observed. We interpret these associations cautiously, however, because so few subjects overall were exposed to the water at times when male-specific coliphage was detected.

The findings from Mission Bay are unique in this field, largely because Mission Bay may be a unique circumstance. Certainly, many other enclosed marine beaches, particularly in California, suffer from impaired water quality due to non-point sources of bacteria and poor circulation. However, it is premature at this time to extrapolate the findings from the current study to other enclosed marine beaches, especially if significant source identification work has not been accomplished. Moreover, the epidemiological findings from Mission Bay were collected from periods of dry weather and no known sewage spills. We would expect to see an increase in health risks, and likely an association with water quality indicators, if large sources of untreated human fecal material entered the Bay. No epidemiological data currently exists for health risks associated with swimming at these beaches following wet-weather events.

None

3. Nature and Purpose

The purpose of the Mission Bay Epidemiology Study is to determine what the health risks are associated with swimming in Mission Bay, located in San Diego, California. Specific illnesses measured will focus on gastrointestinal upsets (GI illness) but will also include respiratory illnesses, skin ailments/complaints, ear ailments/complaints and eye ailments and complaints. An additional goal of the study is to determine the relationship between health and novel and traditional bacterial indicators of water quality. One novel focus of this study will be differentiating the risk of swimmers' exposure to human versus non-human sources of bacteria. Mission Bay is a heavily used aquatic park in San Diego with more than three million visitors annually. Mission Bay suffers from impaired water quality with more than 100 beach postings or closures during 1998. Potential sources of bacterial contamination within its urban watershed are numerous and include dry and wet weather runoff, the sanitary sewerage system, and vessel discharges. Similarly, natural sources within the open lands of the watershed also contribute bacteria, including bacteria from native animals in the chaparral habitat upstream of the Bay and wildlife sanctuaries that line portions of the Bays' shoreline. Currently, health officials and local municipalities are attempting to identify the specific sources of bacterial contamination in the watershed.

Most previous epidemiological studies of exposure to marine waters have focused almost exclusively on swimming waters contaminated by sanitary sewage treatment plants. There has been only one epidemiological study conducted in California to identify the risk of swimming related diseases (Haile, 1999). The Santa Monica Bay Study focused on risks associated with swimming near a storm drain and was used to guide regulations for body contact recreation under California Assembly Bill 411.

While a landmark study because of its focus on runoff, the findings of the Haile study may not be directly applicable to the risks associated with swimming in distinctly different environments such as those found in Mission Bay. Unlike Santa Monica Bay, Mission Bay is not impacted by a single point source of pollution, and much of the pollution may be non-human in nature. Since most human illnesses and infections are transmitted from person to person, non-human waste may not pose as much of a health risk.

It is anticipated that this study will provide health officials and recreational water quality managers valuable information on which to base their decisions about what specific risks are associated with swimming in Mission Bay and related marine environments.

4. Subjects

The target population for the proposed study is Mission Bay beach-goers and swimmers. The study will enroll both adult and children beach-goers at the six most heavily used beaches.

No restrictions will be made based on race, sex, age or other demographic characteristics. English and Spanish speaking beach-goers will be enrolled.

The enrollment goal is to complete surveys on at least 6,000 subjects and up to 7,500 subjects. At least 5,000 subjects will be “swimmers”, defined as those who submerge their head under water during their visit to the beach. The remaining 1,000-2,500 subjects will be “non-swimmers”, defined as those who did not enter the water during their visit to the beach.

We expect that the demographic makeup of our study population will mirror that of beach-goers at all of Mission Bay. A survey of swimmers conducted by the Southern California Coastal Water Research Project (SCCWRP) in 2001 found the following racial distribution among beach-goers:

	Percent	Anticipated Number
Black:	7%	420
White:	52%	3120
Hispanic:	39%	2340
Asian/Pacific Islander:	2%	120

The beach-going population was found to be 49% male and 51% female. The overall average age was 17 years old, and ranged from 1 to 95 years. The age distribution and anticipated numbers enrolled is summarized below:

Percent	Anticipated Number
0-10: 48%	2880
11-20: 17%	1020
21-30: 9%	480
31-40: 11%	660
41-50: 5%	300
51-60: 4%	240
61-70: 2%	120
71-80: 3%	180
81-90: 2%	120
91-100: 1%	60

We anticipate that 98% of the beach-going population will be either English or Spanish speaking.

5. Recruitment

Recruitment of beach-goers will occur on weekends during the summer of 2003, beginning Memorial Day weekend and continuing through Labor Day weekend. Beach-goers will be approached by a bilingual staff of interviewers between 12:00 pm and 5:00 pm each weekend day. Interviewers will briefly describe the nature of the study and determine whether or not the individual is interested in participating. In the case where a family or a household group is attending the beach together, an adult “head of household” will be asked to participate on behalf of other household members. If an individual or household agrees to participate, the interviewers will obtain written consent for the individual or all participating adult members of the household. Adults will give consent for children under 18. For unaccompanied minors, attempts will be made to contact their parents by phone to obtain consent before they are enrolled. If the parents cannot be contacted, the unaccompanied minor will not be enrolled.

The consent process will detail what we are asking subjects to do and will describe the general nature and goals of the study (see section 13, Written Materials, for the consent forms and the language used to recruit beach-goers). If a subject is interested in participating in the study, the interviewers will ask some questions about how much they have swam recently and how much they intend to swim in the next week. Since one goal of the study is to relate measures of microbial water quality to swimming on a specific day, if a subject has swam in the ocean in the past week, they will be excluded. Also, if the subject definitely plans on swimming in the ocean during the next one-week, they will be excluded. This will allow us to accurately assign water quality measures to each swimmer based on a single daily exposure to ocean water.

If a subject is eligible and consents to participating in the study, we will request that they provide us with the names of all eligible and consenting family members; phone number or phone numbers where they can be contacted during the next three days and again in two weeks time; and their city and state of residence.

6. Screening Procedures

All beach-goers are eligible to participate provided that they did not swim in the ocean during the previous seven days. If the reply to this question is “yes”, then the interview will go no further and the subject will be excluded from the study. If the subject did not swim during the past seven days, they will then be asked if they definitely plan on swimming in the ocean during the next seven days. If the answer to this is “yes”, then the subject is not eligible and will be excluded from the study. In the case of minors, an adult household member will be asked these questions on their behalf. No demographic or other information will be collected until their eligibility is determined.

Once the beach-goers eligibility is determined, they will be taken through the consent process. Only after informed consent is obtained will subjects be asked questions relating to the goals of the study.

A script of the screening dialogue is attached in Section 13, Written Materials.

7. Procedures

Consenting subjects and households will be interviewed at three different times. Screening will take place on the beach at the time of enrollment. Subjects will be asked for phone numbers where they can be contacted within three days and once again ten to fourteen days after the beach interview. Names of all participants will be recorded, and each subject will be assigned a non-informative subject ID. At each beach, a study center will be set up where one or more interviewers will be stationed. Participants will be asked to stop by the study center when they are leaving the beach to complete a self-administered Beach Survey. If a consenting subject fails to return to the study center at the end of the day, study staff will follow up with a telephone call to complete the interview. The Screening Interview is attached in section 13.

Participating households will be asked to complete a self-administered Beach Survey as they are leaving the beach for the day. The head of household will complete the survey for other household members. This survey will consist of the following categories of questions: 1) Swimming during the day (how long, approximate times, and what activities); 2) Food and beverages consumed during the day; 3) Illnesses experienced in the past 3 days. Participants will not be asked about existing immunocompromising conditions (i.e. cancer or HIV/AIDS) during the beach interview. These surveys will be self-administered, but interviewers staffing the study centers will be available to answer questions. Participants, who are unable to return to the study center to complete the interview, may be telephoned the next day as necessary, and the interview

will be completed on the phone. The Beach Survey will take no more than 10-15 minutes to complete. Parents or guardians will answer for children under 18.

Ten to fourteen days following the beach visit, participants will be telephoned and asked to complete the 10-15 minute Illness Interview. This interview will consist of the following types of questions: 1) Demographic information, including race, income, education level; 2) Swimming exposure since the interview day; 3) Existing health problems potentially related to the study outcomes (e.g. chronic diarrhea); 4) Types of food consumed since the beach interview ; 5) Prescription and non-prescription medications; 6) Acute health conditions (GI, respiratory, skin, eye or ear) experienced since the visit to the beach; and 7) General immunocompromising conditions (i.e. cancer or HIV/AIDS). Data will be collected during this interview through “computer-assisted telephone interview” (CATI) at the UC Berkeley Survey Research Center. As with the previous interviews, the head of household will answer for children under 18 and other household members.

The Screening Interview, Beach Survey and Illness Interview are attached in Section 13, Written Materials.

8. Benefits

There are no direct benefits to subjects participating in this research project. We hope that this research will indirectly benefit all of those who use the beach for swimming by helping to provide a better understanding of the risks associated with swimming in Mission Bay and similar ocean waters. Research of this type may ultimately provide safer recreational waters by encouraging appropriate legislation and action by recreational water managers.

9. Risks

Since this is strictly an observational study, there will be minimal risk to participants. Subjects will not being asked to modify their behavior in any way, and will not be encouraged or discouraged from swimming in the ocean.

10. Confidentiality

There will be a slight risk of the loss of the confidentiality of certain health conditions. Extensive precautions will be made to ensure this does not occur. No information will be collected on specific immunocompromising conditions. Identifying information will be stored separately from health information at all times. Health data will be identified with a non-informative subject ID. All information collected as a part of this research project will be kept in a locked file in a secure location, or in password protected computer files. The key to the code of the individual subject identities will be kept in a separate locked file, away from the data. No individual subject will be identifiable in any presentation or publication of the data.

11. Informed Consent

The consent process will be as follows: Beach-goers will be approached and their eligibility to participate will be determined. Those interested and eligible for the study will be given a consent form to read. Interviewers will be present to answer any questions. Each adult in the household will read and sign the consent form, and an adult household member will consent for children under 18. The consent form is attached in section 14, Written Materials.

12. Financial Aspects

When subjects complete the Beach Survey, they will be given a t-shirt with the study logo on it to show our appreciation for their participation.

13. Written Materials

The following written materials and interview scripts are attached:

Introduction script

Screening

Beach Survey

Illness Survey

Consent

ID #: _____
A B C D

**Mission Bay
BEACH SCREENER**

Date: _____
Int #: _____

Hi, my name is _____. I am conducting the Mission Bay Water Evaluation Survey.

Here is a pamphlet describing the study. (**GIVE RESPONDENT THE CONSENT TRI-FOLD PAMPHLET**)

This summer, we're asking beachgoers here at Mission Bay to help us with an important research project. The purpose is to develop better guidelines and methods to insure safe beach water quality and to better understand how bacteria and viruses in the water might affect the health of swimmers. [It takes very little time. First, I would gather a little information right now and give you a consent form to sign (and a copy to keep for your records.) Then you would stop at our tent on the way out to fill out a questionnaire about your activities at the beach today. We'll give you a beach ball and water bottle, and we'll call you in 10 days to two weeks to ask some questions about your health since you visited the beach today.]

I would like to ask you a few questions to see if you're eligible.

1. Have you already participated in our study this summer? (We've been interviewing people since Memorial Day.)

No
↓

Yes (THANK YOU FOR YOUR HELP)

2. What is your age? _____

IF UNDER 18: Is there an adult family member 18 or older here with you today?

Yes (GO TO ADULT)
REPEAT Q1 AND Q2

No → (THANKS A LOT, WE NEED TO
SPEAK TO PEOPLE WHO ARE
OVER 18.)

3. Are you from the San Diego Area or are you visiting?

From area

Visiting

Where are you from? _____

State

Country

(MUST BE FROM US, CANADA OR MEXICO)

4. A. How many family members who live with you are at the beach today?

_____ Members
↓

None → **SKIP TO 6A**

5. Whenever possible, we like to include all family members. A parent or guardian can answer questions for the other family members. Are you the parent or guardian?

Yes

No → **IF NO:** Ask to speak to parent/guardian **GO TO Q1**
 Enroll respondent as an individual **GO TO Q6**

6. A. Not counting today, in the last 7 days, have you been swimming in the ocean or at a lake where you got your face or head under the water?

Yes (NOT ELIGIBLE) No

B. **IF PARENT OR GUARDIAN:** How about the other family members here with you today?

Yes all (NOT ELIGIBLE) Yes (SOME ELIGIBLE) No (ALL ELIGIBLE)

7. A. Do you plan to swim and put your head or face under the water in the next week?

Yes

No

B. How about other family members.

Yes

No

You/your family members who have not been swimming in the last week are eligible to participate.

Here's what we'll be asking you to do:

We'll collect a little information from you now.

Then, we will ask you to stop by our tent when you leave the beach today and fill out a questionnaire about your and your family's activities today. It just takes a couple of minutes (roughly 2 minutes per person). You can complete the questions for your family members or other adults can complete for themselves... whichever is most convenient. Each participant will receive a beach ball and water bottle as a thank you gift.

We'll call you in 10 days to 2 weeks and conduct a brief phone interview about your general health and any health problems you or your family members might have experienced after swimming in the ocean.

8. We would really appreciate it if you (and your family) can help us out.

Yes No

IF NO: Why do you think R refused?

Too busy

No longer interested

Will not be available

Other reason? (*PLEASE SPECIFY:* _____)

Take a moment to read and sign the consent form and print the names of the other family members who are here with you today who will be participating. (All adults 18 and older must sign for themselves. Children 13 to 17 initial the form if they wish.)

Then, we'll be calling you in about 10 days to ask some questions about your health since you visited the beach.

9. A. What phone number should we call?

() _____

No phone (*NOT ELIGIBLE*)

B. Is this your home, vacation, or cell phone number?

Home Phone Vacation Phone Cell Phone Other (*SPECIFY:* _____)

C. Is there another number we should try if we don't reach you?

Yes (→) _

No E-MAIL _____

10. What's generally the best time to reach you?

Morning Afternoon Evening

Weekday

Saturday.....

Sunday.....

Thank you very much for your help. Remember to stop by the study center over there (points out study center) to complete the beach survey and pick up your beach ball(s) and water bottle(s). We'll call you in 10 days or so.

MISSION BAY WET
Primary Adult Questionnaire

First Name: _____

 Male Female

- 1. How much time did you spend at the beach today?**

_____ hours _____ minutes

- 2. A. Did you wade, swim, or play in the water today?**

¹ Yes
² No → Go to Q7

- B. Did you get water in your face?**

¹ Yes
² No → Go to Q3

- C. Did you get in the water up to your shoulders today?**

¹ Yes
² No

- D. Did you put your face or head under the water?**

¹ Yes
² No

- E. Did you get water in your mouth?**

¹ Yes
² No → Go to Q3

- F. Did you gag or cough after getting water in your mouth?**

¹ Yes
² No

- G. Did you swallow any water?**

¹ Yes
² No

- H. How many mouthfuls do you think you swallowed?**

- 3. Were you in the water at any of the following times today? (CHECK ALL THAT APPLY)**

¹ Before 10 AM ¹ 10 AM - Noon
¹ Noon - 2 ¹ 2 - 4
¹ After 4 PM ¹ Did not go in the water

- 4. What was the total time you were actually in the water today?**

_____ hours _____ minutes

- 5. Did you engage in any of the following water-related activities while at the beach today? (CHECK ALL THAT APPLY)**

¹ Sailing or boating ¹ Swimming near shore
¹ Windsurfing ¹ Kayaking or rowing
¹ Jetskiing or waterskiing
¹ Wakeboarding or kiteboarding
¹ Rafting/tubing/floating on air mattress
¹ None of these activities

- 6. Did you wear any of the following items while you were in the water today? (CHECK ALL THAT APPLY)**

¹ Ear plugs ¹ Nose plugs
¹ A wet suit ¹ Eye goggles or a face mask
¹ None of these items

- 7. Did you do any of the following activities while at the beach today? (CHECK ALL THAT APPLY)**

¹ Collect sea shells, rocks, feathers, etc.
¹ Dig in the sand or build sand castles
¹ Have your body buried in sand
¹ Play with algae or seaweed
¹ Go crabbing or fishing
¹ None of these activities

- 8. Did you wear any of the following at the beach today? (CHECK ALL THAT APPLY)**

¹ Insect repellant
¹ Sunscreen/sunblock
¹ Hat or other protective clothing
¹ None

- 9. A. Did you use protective equipment such as a canopy, umbrella or other type of sunshade?**
- ¹ Yes
² No
- B. Not counting the time you spent indoors or under umbrellas, what do you think your total time in direct sunlight was?**
- ¹ Less than one hour ² 1-2 hours
³ 3-4 hours ⁴ 5-6 hours
⁵ More than 6 hours
- 10. Did you eat food at the beach today?**
- ¹ Yes → **Where did you get the food?**
(CHECK ALL THAT APPLY)
- ¹ From home
¹ From vending machines or a vender at the beach
¹ From a vender outside the beach
- ² No
- 11. Did you drink alcohol at the beach today (including beer, wine, hard liquor or any drink made with alcohol)?**
- ¹ Yes → **How many drinks with alcohol did you have today?** (A drink is:
1 glass of wine or a wine cooler,
1 can/bottle of beer, 1 shot of liquor or 1 mixed drink)
- ¹ Less than 1 ² 1 - 2
³ 3 - 4 ⁴ 5 or more
- ² No
- 12. Did you cut yourself today or have an open cut when you came to the beach?**
- ¹ Yes
² No
- 13. Did you take a shower before leaving the beach?**
- ¹ Yes
² No
- 14. Did you use the bathroom facilities at the beach today?**
- ¹ Yes
² No
- 15. In the past 48 hours, have you eaten any of the following? (CHECK ALL THAT APPLY)**
- ¹ Dairy products such as milk, cheese or ice cream
¹ Raw or runny eggs
¹ Chicken
¹ Meat that was red in the center
¹ Hot dogs
¹ Any food containing mayonnaise
¹ Raw seafood
¹ None of these foods
- 16. In the last 48 hours have you done the following? (CHECK ALL THAT APPLY)**
- ¹ Touched or come into contact with any animal or its feces
¹ Come into contact with someone who has complained of diarrhea, vomiting, or stomach illness
¹ None of the above
- 17. Have you been sick in the past 3 days with: (CHECK ALL THAT APPLY)**
- ¹ Diarrhea or loose bowels
¹ Throwing up or vomiting
¹ Sore throat or cough
¹ Earache, ear infection or discharge
¹ Eye infection, irritation, or redness
¹ Rash or itchy skin
¹ Sunburn
¹ None
- 18. Have any household members not present at the beach today been sick in the past 3 days with: (CHECK ALL THAT APPLY)**
- ¹ Diarrhea or loose bowels
¹ Throwing up or vomiting
¹ Sore throat or cough
¹ Earache, ear infection or discharge
¹ Eye infection, irritation, or redness
¹ Rash or itchy skin
¹ None

Completed by: _____
First Name _____

SAN DIEGO WET CATI FOLLOW-UP INTERVIEW

INTRODUCTION We have some follow-up health questions about you and the other family members who participated in our study at the beach on (date). According to our records (list names) participated.

First I have some general health questions.

Q. Do you have Allergies other than drug allergies? YES NO
How about... (List other household members)

Do you have skin problems such as psoriasis or eczema? YES NO
How about...(List other household members)

Do you have Chronic respiratory diseases such as asthma or emphysema? YES NO
How about..(List other household members)

Do you have Gastrointestinal problems such as Crohn's disease or irritable bowel syndrome?
YES NO How about (List other household members)

Do you have any immunocompromising condition such as cancer or HIV/AIDS?
YES NO How about...(List other household members)

Q. V1 14 years and older (link to illness questions)

Are you currently working outside the home or going to school for 20 hours a week or more?
YES NO How about (others 14 and over)

V2 13 and younger (link to illness questions)

Is (name) currently in school, camp or other activity 20 hours a week or more? YES NO
How about (List other household members)

**Now I have some questions about your health since we interviewed you at the beach
on (date)**

Q. Are you currently pregnant? (Ask for all women 14 and above))

Q. Since we interviewed you at the beach, have you taken any prescription medications? YES NO
(List other household members)
How about non-prescription medications? YES NO
(List other household members)

Q Since your visit to the beach on (Date) have you had any of the following problems or symptoms: (List for all household members)

How about a Fever? Yes No

- If yes, on what date did your/his/her fever begin?
- Did you see a doctor or visit a hospital for this condition?
- Did you miss work or school for this condition? (if applicable)
- If yes, how many days?
- Did you limit your (other) regular activities because of this condition? If yes, how many days?
- Did you take any medications because of this condition?

How about Chills Yes No

- If yes, repeat follow-up questions

How about redness or eye irritation Yes No

- If yes, repeat follow-up questions

How about an earache? Yes No

- If yes, repeat follow-up questions

How about discharge or draining from the ear: Yes No

- If yes, repeat follow-up questions

How about a skin rash Yes No

- If yes, repeat follow-up questions

How about cuts or scrapes that became infected? Yes No

- If yes, repeat follow-up questions

How about Nausea? Yes No

- Repeat follow-up questions
- Was this because of your pregnancy? (if pregnant)

How about vomiting? Yes No

- If yes, repeat follow-up questions

How about diarrhea? Yes No

- If yes, repeat follow-up questions
-

How about stomach pain or cramps Yes No

- If yes, repeat follow-up questions

How about coughing with phlegm or congestion? Yes No

- If yes, repeat follow-up questions

How about coughing without congestion? Yes No

- If yes, repeat follow-up questions

How about nasal congestion or a runny nose? Yes No

- If yes repeat follow-up questions

How about a Sore throat? Yes No

- If yes, repeat follow-up questions

Q. (Ask if other members were not present at the beach interview) Now I have a few health questions about the household members who were not at the beach with you on the day you were interviewed. Since your beach interview on (date), has/have any of these other household member(s) had

- A fever? Yes No
- How about Chills Yes No
- How about redness or eye irritation? Yes No
- An earache? Yes No

- How about discharge or draining from the ear ? Yes No
- How about a skin rash? Yes No
- How about cuts or scrapes that became infected? Yes No
- How about Nausea? Yes No
- How about vomiting ? Yes No
- How about diarrhea? Yes No
- How about stomach pain or cramps Yes No
- Coughing with phlegm or congestion? Yes No
- How about coughing without congestion? Yes No
- How about nasal congestion or a runny nose? Yes No
- How about a Sore throat? Yes No

Now I have some questions about swimming activities since we interviewed you at the beach on (date)

Q. Have you, (list other household members) visited a beach since that time? Yes No

If yes: Did you, (list other household members) go to the same beach at Mission Bay since your last interview? Yes No

If yes: Did you, (list other household members) go to a different ocean beach since your beach interview?

If yes: Did you, (list other household members) go to a lake or river beach since your interview? Yes No

For each reported beach ask for each household member:

- Did (you/person) go swimming at (beach name)? Yes No dk
- On which dates did you/person swim since your beach interview ? _____
- Did you/he she get your face wet or put your/his/her head under water?

Q Since your beach interview, did you swim in a private pool?... Yes No

How about (list other household members)? *IF YES* Did you/ he/she get his/her face wet or put his/her head underwater?

Q . Since your beach interview, did you swim in a public pool?... Yes No
How about (list other household members)? *IF YES* Did you/he/she get his/her face wet or put his/her head underwater?

Q. Since your beach interview, did you use a private hot tub or spa?... YesNo
How about (list other household members) ? *IF YES* Did you/he/she get his/her face wet or put his/her head underwater?

Q. Since your beach interview, did you use a public hot tub or spa?... Yes No
How about (list other household members) ? *IF YES* Did you/ he/she get his/her face wet or put his/her head underwater?

Q. (Ask of R and about family members 15 and older) How concerned are you about the quality of the water you use for recreational purposes? Would you say:
Very concerned Somewhat concerned Not very concerned Not at all concerned

Now I have a few quick questions about other activities since we interviewed you at the beach.

Q. Since the day of the beach interview, have you eaten in a restaurant (including fast food restaurants)? YES NO (ask for all household members)

Q Since the day of the interview, have you eaten any of the following? YES NO (ask for all household members)

- Raw or runny eggs
- Soft cheeses
- Meat that was red in the center
- Raw seafood

Q Since the day of the interview, did you drink any alcohol? (including beer, wine, hard liquor or any drink made with alcohol)? YES NO (ask for all household members)

For the purpose of this study, a drink is 1 glass of wine or a wine cooler, 1 can/bottle of beer, 1 shot of liquor or 1 mixed drink)

Q Since we interviewed you/other household member at the beach, how many drinks containing alcohol have you had per day on average? Would you say less than 1 per day, 1-2 per day 3-4 per day 5 or more per day?

Q Since your beach interview, what is the highest number of drinks containing alcohol you have had in a 24 hour period? _____

Q Since your beach interview, have you taken a trip where you spent at least one night away from home? YES NO (Ask for all household members)

- If yes, did you travel to an area outside the United States? YES NO
- If yes, did you visit an area where you were told not to drink untreated water? YES NO

Q Since your beach interview, did you touch any animals that were not familiar to you such as farm animals or animals at a petting zoo? YES NO (Ask for all household members)

Q. Since your beach interview, have you visited a children's day care center? YES NO (ask for all household members)

(for anyone who reports a job) Do you work at (or volunteer) at a children's daycare center?

Q. Since your beach interview, have you changed a child's diaper? YES NO (ask for 3 years and above)

Q. Have you ever been concerned about the health effects of swimming in the ocean or in lakes or rivers? No Yes...Were you concerned about it before you did this study? Follow-up (ask for age 16 and above)

Demographic questions:

What race or ethnicity do you consider yourself...(Insert Census list)

Are you Hispanic or Latino? (Ask sub groups Mexican, etc. to be decided)

Ask for all participants with option for "same"

What is your household's approximate annual income? (Insert standard language and income ranges in increments)

CONSENT FORM MISSION BAY EPIDEMIOLOGY STUDY

Jack Colford, MD, Ph.D, Associate Professor
School of Public Health, University of California, Berkeley

My name is Dr. Jack Colford of the University of California at Berkeley School of Public Health. My research team and I are working with the Southern California Coastal Water Research Project on a research study of the health of swimmers in Mission Bay.

We would like to ask you and your family members to help us in this study by answering a few questions today. We will also ask you to answer a few more questions on the phone in two weeks time. The interviews will take between 10 and 15 minutes each. Most of the questions will be about illnesses you and your family have experienced recently, like diarrhea, nausea, vomiting, or skin rashes. We will also ask you a few questions about your day at the beach, like what types of food you ate and whether or not you went swimming.

Your participation is voluntary and you may stop the interview at any time. You may refuse to answer any question you don't feel comfortable answering. Your responses to the questions will be confidential and your address and other contact information will be destroyed after you complete both interviews.

For helping us with this study, we will give you a t-shirt, water bottle, beach tote, towel or other item with the study logo on it when you finish the beach interview at the end of the day.

There are no direct benefits to you and your family, but we hope that this study and others like will help scientists understand what the health risks are, if any, of swimming in oceans. However, there are no foreseeable risks to you or your family from participating in this research.

If you have any questions about your rights as a research subject, you may talk to the Committee for the Protection of Human Subjects at (510) 642-7461, or by email at subjects@uclink.berkeley.edu. If you or your family have any questions about the research, before or during the study, you may call our program manager, Catherine Wright, at (510) 643-5378 (collect if necessary).

I have read this form and understand this study. I have had a chance to ask questions, and all my questions have been answered. I have discussed the research with all the members of my household. I agree to take part in the research.

Appendix 2

Results of Analyses of Health Outcomes vs Water Exposure

Age Categories

- 1 = 0 – 5 years
- 2 = 5 – 12 years
- 3 = 12 – 30 years
- 4 = 30 years and older

Mission Bay Beaches

- 1 = Visitor's Center
- 2 = Tecalote Shores
- 3 = Leisure Lagoon
- 4 = De Anza Cove
- 5 = Crown Point
- 6 = Bonita Cove

Health Outcomes Analyzed

Gastrointestinal Outcomes:

- HCGI1:
- HCGI2:
- Diarrhea
- Nausea
- Vomiting
- Cramps

Skin Outcomes:

- Skin Rash

Respiratory Outcomes:

- SRD: xxDefinition
- Cough
- Fever
- Sore Throat

Eye Outcomes:

- Eye Irritation

Ear Outcomes:

Earache
Ear Discharge

Water Exposures Analyzed

Any Water Exposure

Water up to Shoulder

Water on Face

Face Under Water

Water in Mouth

Swallow Water

GASTROINTESTINAL OUTCOMES vs WATER EXPOSURE

Page number refers to page in output "hcgiswimonly.doc"

Appendix 3

Health Outcomes vs. Water Quality Indicator Water Exposures Analyses

Age Categories

- 1 = 0 – 5 years
- 2 = 5 – 12 years
- 3 = 12 – 30 years
- 4 = 30 years and older

Mission Bay Beaches

- 1 = Visitor's Center
- 2 = Tecalote Shores
- 3 = Leisure Lagoon
- 4 = De Anza Cove
- 5 = Crown Point
- 6 = Bonita Cove

Health Outcomes Analyzed

Gastrointestinal Outcomes (Tables 1 – 107):

- HCGI1: xxDefinition
- HCGI2: xxDefinition
- Diarrhea
- Nausea
- Vomiting
- Cramps

Skin Outcomes (Tables 108 – 126):

- Skin Rash

Respiratory Outcomes (Tables 127 – 198):

- SRD: xxDefinition
- Cough
- Fever
- Sore Throat

Eye Outcomes (Tables 199 – 234):

- Eye Irritation

Ear Outcomes (Tables 235 – 252):

- Earache
- Ear Discharge

Water Exposures Analyzed (only selected exposures are presented in this appendix)

Any Water Exposure

Water up to Shoulder

Water on Face

Face Under Water

Water in Mouth

Swallow Water

Indicator Variable List and Definitions (only selected exposures are presented in this appendix):

Indicator Variable Name	Definition
lg_mean_beach_entero	natural log geometric mean for enterococcus – beach level
lg_mean_station_entero	natural log geometric mean for enterococcus – station level
lresult_entero_comp	natural log result enterococcus – composite sample
lmax_beach_entero	natural log maximum enterococcus – beach level
lmax_station_entero	natural log maximum enterococcus – station level
mlresult_entero_time	enterococcus, averaged by time of swimming (mean natural log)
lg_mean_beach_fecalcoli	natural log geometric mean fecal coliform – beach level
lg_mean_statio_fecalcoli	natural log geometric mean fecal coliform – station level
lmax_beach_fecalcoli	natural log maximum fecal coliform – beach level
lmax_station_fecalcoli	natural log maximum fecal coliform – station level
mlresult_fecalcoli_time	fecal coliform, averaged by time of swimming (mean natural log)
lg_mean_beach_totalcoli	natural log geometric mean total coliform – beach level
lg_mean_station_totalcoli	natural log geometric mean total coliform – station level
lmax_beach_totalcoli	natural log maximum total coliform – beach level
lmax_station_totalcoli	natural log maximum total coliform – station level
mlresult_totalcoli_time	total coliform, averaged by time of swimming (mean natural log)
m_lentpcr_beach	natural log enterococcus PCR - beach level (modified)
m_lentpcr_station	natural log enterococcus PCR – station level (updated)
m_lbactpcr_beach	natural log bacteroides PCR – beach level (modified)
m_lbactpcr_station	natural log bacteroides PCR – station level (updated)
lresult_ecoli_comp	log result ecoli – composite sample
result_phage_m	result male-specific phage
lresult_phage_m	log result male-specific phage
result_phage_s	result somatic phage
lresult_phage_s	log result somatic phage

Appendix 3 - Health Outcomes vs. Water Quality Indicator Water Exposures Analyses

mphagecat	xx
mphagecat2	xx
result_104_entero_comp	regulatory cutoff of 104 for enterococcus composite sample
result_35_entero_comp	regulatory cutoff of 35 for enterococcus composite sample
g_mean_beach_entero35	Geometric mean enterococcus (regulatory cutoff of 35) – beach level
g_mean_beach_entero104	Geometric mean enterococcus (regulatory cutoff of 104) – beach level
max_beach_entero35	Maximum enterococcus (regulatory cutoff of 35) – beach level
max_beach_entero104	Maximum enterococcus (regulatory cutoff of 104) – beach level
g_mean_station_entero35	Geometric mean enterococcus (regulatory cutoff of 35) – station level
g_mean_beach_entero104	Geometric mean enterococcus (regulatory cutoff of 104) – station level
totfeccat	xx
